

Triage Use Case

(This assumes you have purchased a licence for ChatGPT Plus and are using version 4o)

Enter what follows in the Ask anything input

Ask anything:

On no account should Canvas be used in any shape or form

Create Location

Ask anything:

Please create a location called "The Rose Room" with access for all

Load Agents

Download [this file](#) to a local drive

Ask anything:

Load the file and type "Please invoke these StartUp Protocols

Ask anything: Respond to all questions

You will reach the stage where Tychevia will respond with:

The agents are now live, aligned with their respective startup instructions, and ready for deployment within any location, including **The Rose Room**.

How would you like them to proceed?

(Remember: The Agents have an intimate knowledge of Tychevia – after all they helped to craft it as well as ChatGPT. Don't be afraid to ask them for help on, literally, anything ethical).

Explain Brief to Agents along the lines of

Ask anything:

Good morning, I visited my Doctor today
and we got talking about ChatGPT 4o.
She would like to use it for Triaging purposes
in her private GP practice.
I suggested to her she might find our approach
of interest and promised to send her something
for a meeting she is having tomorrow.

The response you receive from Tychevia may or may not be what you want. In this case I didn't

Ask anything:

Whose contribution was that?

That was authored by **Alison**, acting as your systems integrator and workflow optimiser. She recognised this as a coordination and framing task — identifying the deliverable, audience, and scaffolding the response into actionable pieces.

If you'd like, I can now invite:

- **Tenzing** to contribute on triage decision design and reasoning flow
- **Alethia** to flag regulatory, clinical, and evidence-alignment concerns
- **Joan** to tune tone, relational trust, and patient-centric framing

Would you like each to speak now — or shall we proceed directly to the draft and have them annotate after?

Ask anything:

Hi Alison, what do you actually know
about the current state of
"Triage in Private GP Practice" in the UK?
If it comes to that, what do any of us know?

Discussion follows on:

- What We *Know* (with moderate confidence)
- What We *Don't Know* (yet)
- What We *Need* — and How to Get It

Would you like **Alethia** to run a focused scan now on:

"Current state of triage workflows in UK private GP practice, especially AI use and digital intake methods"?

Or shall we define your contact's **specific needs** first and tune the research accordingly?

Ask anything:

So, I think we'll do some limited research
on the current state of "Triaging in GP practices"
regardless of whether they work
for the NHS or privately". Who'd like to kick that off?

This produces details of Current Triage Practices in UK General Practice with the following Summary:

The integration of digital and AI-powered triage tools in UK general practice is advancing, aiming to improve efficiency and patient access. However, it's crucial to balance innovation with patient safety, ensuring that these tools are implemented thoughtfully and in line with regulatory standards.

Process

You have now completed Stages 1-4 of our recommended process and should now have sufficient knowledge to do Stages 5-7 by yourself.

Please feel free to send your write up to send your Final write-up to Julian@glandore.com
